AFFAIRE DU PLATEAU CONTINENTAL

(TUNISIE/JAMAHIRIYA ARABE LIBYENNE)

VOLUME VI

TABLE OF MAPS, CHARTS AND ILLUSTRATIONS

This Table lists the maps, charts and illustrations in the order of their appearance within the written proceedings. In the margin, the ringed Arabic numerals correspond to the numbering of the maps, etc., reproduced in this Volume, whereas Roman numerals indicate the Volume in which those left in the text are to be found. The absence of any marginal reference signifies that the illustration in question has not been reproduced in this edition.

The Table also lists, with similar indications, the illustrations deposited during the oral proceedings which have been reproduced either in this Volume or as inserts in the oral arguments. It does not however mention in this context the maps used during the hearing which had already appeared in the written proceedings or have not been reproduced in this edition ; for references to these, the reader should turn to the text of the oral arguments or to the correspondence (Vols. **IV** and **V**).

TABLE DES CARTES ET ILLUSTRATIONS

La présente table regroupe les cartes ou illustrations des pièces de procédure écrite en suivant leur ordre dans ces pièces. En marge, les chiffres arabes cerclés correspondent au numérotage des cartes reproduites dans le présent volume ; les chiffres romains indiquent le volume où se trouvent les cartes laissées dans le texte. L'absence de toute indication en marge dénote les cartes ou illustrations non reproduites dans la présente édition.

Cette table comprend également, avec les mêmes indications, les cartes déposées en procédure orale qui sont reproduites soit dans le présent volume, soit dans le texte des plaidoiries. En revanche elle ne donne pas les cartes utilisées en audience qui figuraient déjà dans des pièces de procédure écrite ou qui n'ont pas été reproduites dans la présente édition ; pour en trouver les références, il convient de se reporter au texte des plaidoiries et de la correspondance (vol. **IV** et **V**).

SOURCES: D'après P.F. Burollet et al.1971 in" Tectonique de l'Afrique UNESCO Paris. p.410 (Schéma Tectonique· général), Petrolium Exportation Society of Libya 1967. Guide book to the geology and history of Tunisia. Neuvieme excursion annuelle, Holland Breumelhof.— Amsterdam.

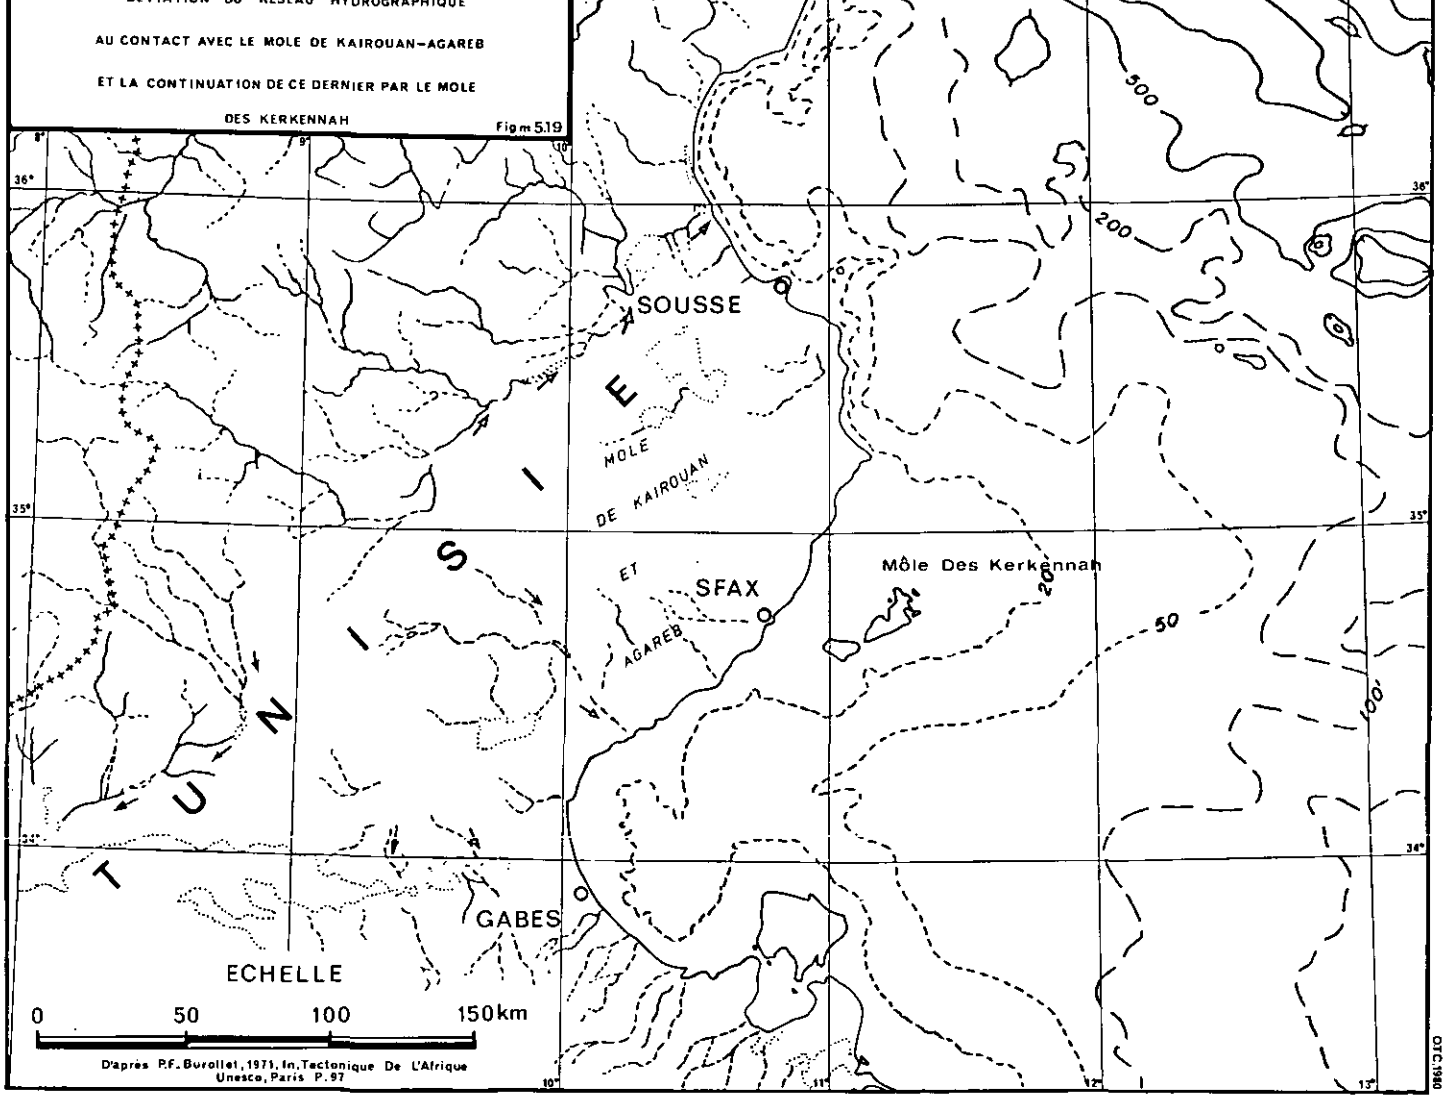
DEVIATION DU RESEAU HYDROGRAPHIQUE

AU CONTACT AVEC LE MOLE DE KAIROUAN–AGAREB

ET LA CONTINUATION DE CE DERNIER PAR LE MOLE

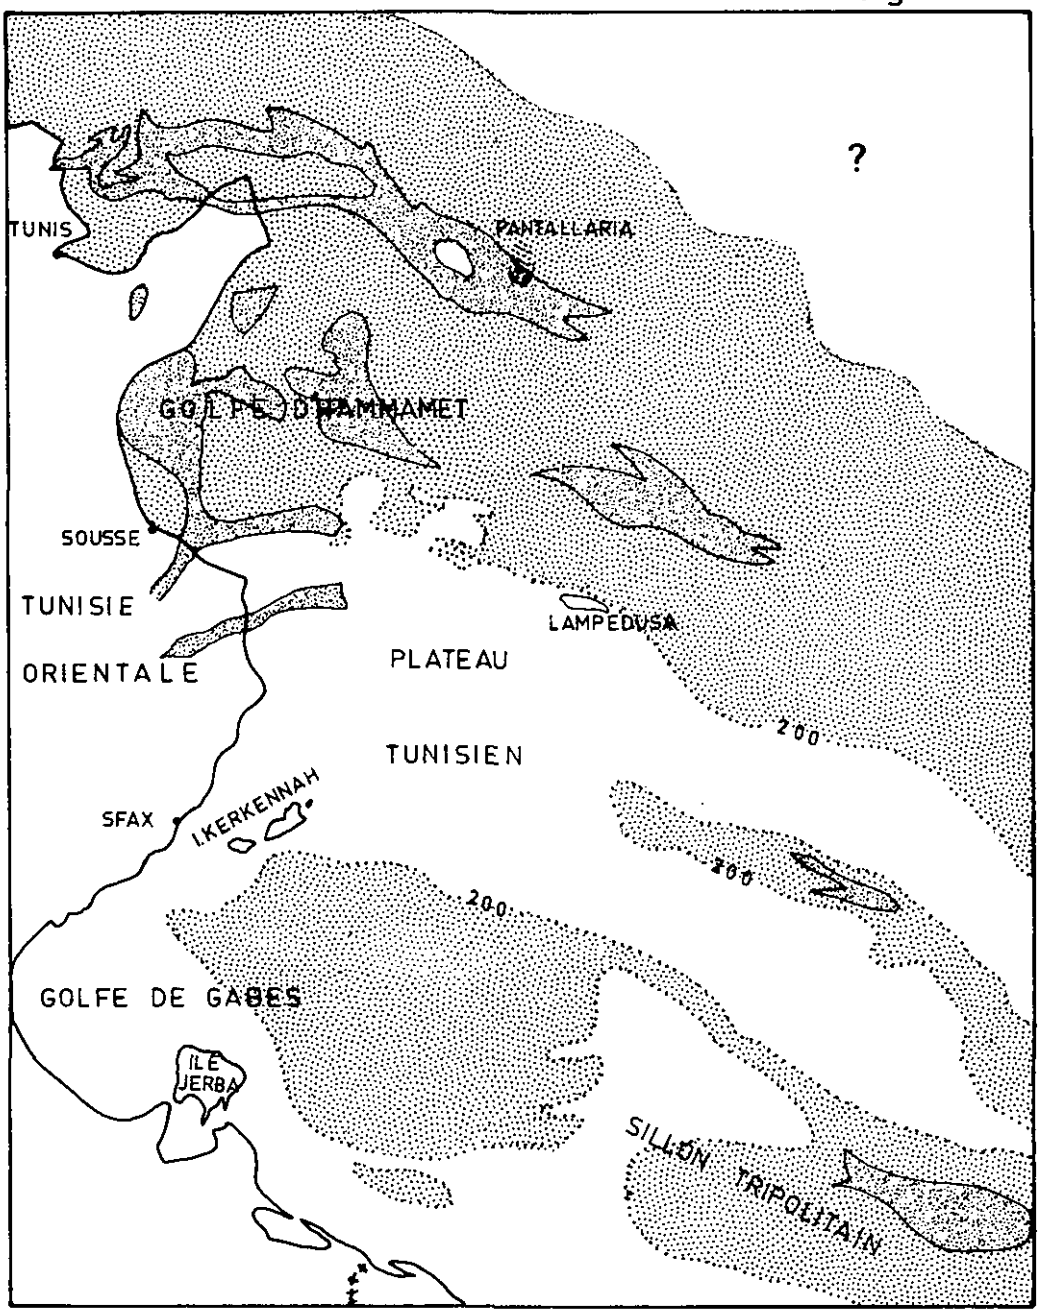
DES KERKENNAH

Figure 5.19



EPAISSEURS DES TERRAINS PLIOQUATERNAIRE A L'EST DE LA TUNISIE

Fig nº 5.20



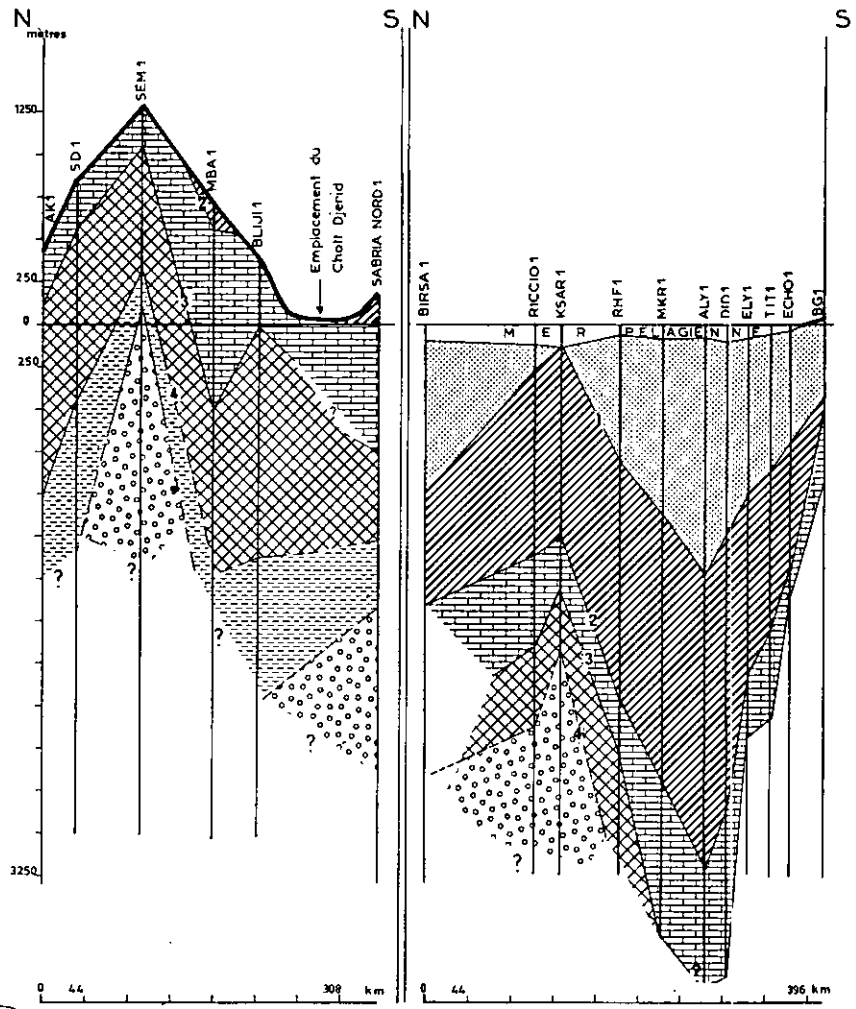
Epaisseur supérieure à 1000 m (zône de forts affaissements)
Epaisseur comprise entre 200 et 1000 m.
Epaisseur inférieure à 200 m.

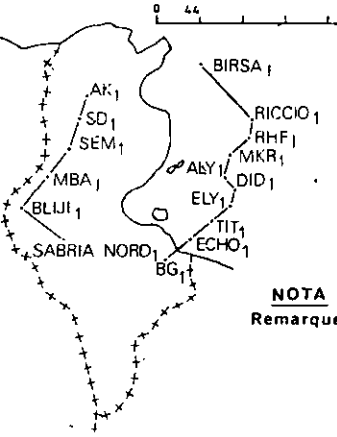
0 50 km

NOTA : Remarquer le Plateau Tunisien et son extension vers l'EST, ou la sédimentation est peu epaisse comparée au NORD (Golfe de Hammamet) et au SUD (Golfe de Gabès et Sillon Tripolitain) où les épaisseurs sont beaucoup plus importantes.

EXTRAIT DE : E.WINNOK ET F BEA ; IN "LA MER PELAGIENNE" ; 1979 ; P.36.

Fig n° 5.21 COUPES GEOLOGIQUES NORD-SUD A TRAVERS L'AXE DES MOLES





Légende :

-1- Sommet de la formation Aïn Grab du Miocène (environ 15 millions d'années)

-2- Sommet de la formation Abiod du Crétacé supérieur (environ 65 millions d'années)

-3- Sommet de la formation Zebbag du Crétacé inférieur (environ 80 millions d'années)

-4- Sommet de la formation Serdj du Crétacé inférieur (environ 105 millions d'années)

-5- Base de la formation Serdj

NOTA

Remarquer : - Un maximum d'épaisseur au droit du sondage (ALY 1) prolongeant en mer et vers l'Est l'épaississement sédimentaire observé en Tunisie méridionale (Sondages MBA 1 - Bliji)

- Un minimum d'épaisseur au centre (Ksar 1) prolongeant vers l'Est les minima connus en Tunisie Centrale et Orientale (Sondage SEM 1)

- Une augmentation d'épaisseur au Nord (Birsa 1) dans le golfe d'Hammamet indiquant la prolongation des zones épaisses de la Tunisie Septentrionale (Sondage AK 1)

Fig. (4A and B) Tethys (the E-W running sea separating the European and African plates some 100 million years ago) at its maximum development is thought by some to have been bounded on the west near Nova Scotia by a single primeval continent, Pungea (white 4A). Others believe that during this period the Tethys separated North America, which belonged to Laurasia, from South America and Africa, a part of Gondwanaland (4B) (Sylvester *et al.*. 1968).

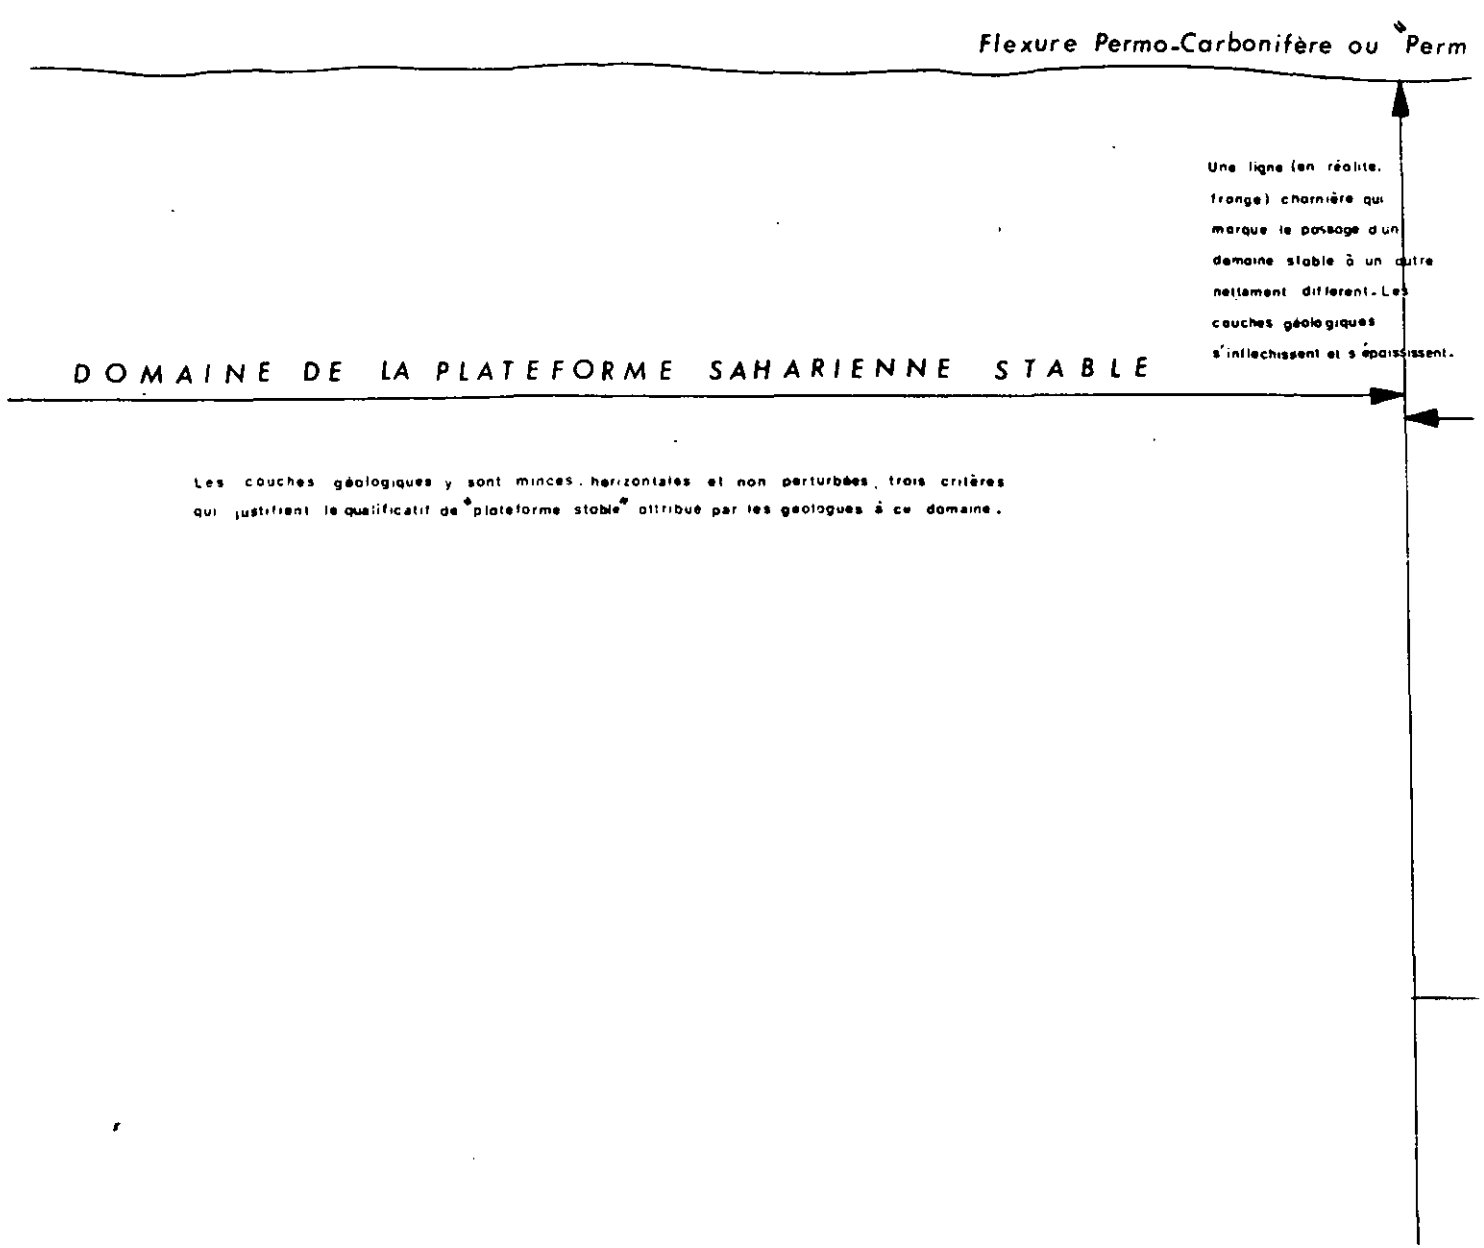
Le Rivage actuel
La zone du rivage constitue sans équivoque une zone de discontinuité: les couches géologiques déposées après le crétace supérieur (Turono-Cénomanien, environ 80 MA) se limitent au domaine marin du bloc pelagien. Elles ne se retrouvent pas dans le domaine de la plateforme.
ARC DE LA JEFFARA
Zone de passage où les couches géologiques changent nettement d'épaisseur et s'inclinent fortement en profondeur: à la stabilité du domaine de la plateforme s'oppose ici une subsidence importante.
LE DOMA
Il est le siège:
- D'une subsidence très impo
- De couches géologiques for
- De percements salifères (sa
500 à 2000 m de largeur
- De couches géologiques de
LE BLOC



Flexure Permo-Carbonifère ou "Perm
Une ligne (en réalité, frange) charnière qui marque le passage d'un domaine stable à un autre nettement différent. Les couches géologiques s'infléchissent et s'épaississent.
DOMAINE DE LA PLATEFORME SAHARIENNE STABLE
Les couches géologiques y sont minces, horizontales et non perturbées, trois critères qui justifient le qualificatif de "plateforme stable" attribué par les géologues à ce domaine.

Fig. 4.01

Figure 9

Location map of geologic profiles and wells from the north coast of Libya. Dashed line shows the location of the geologic cross-section shown in Figure 10 and solid line the location of the geologic cross-section shown in Figure 11. Subsidence curves for wells C1-137, A1-NC35 and B1-NC35 are shown in Figure 12.

Figure 9

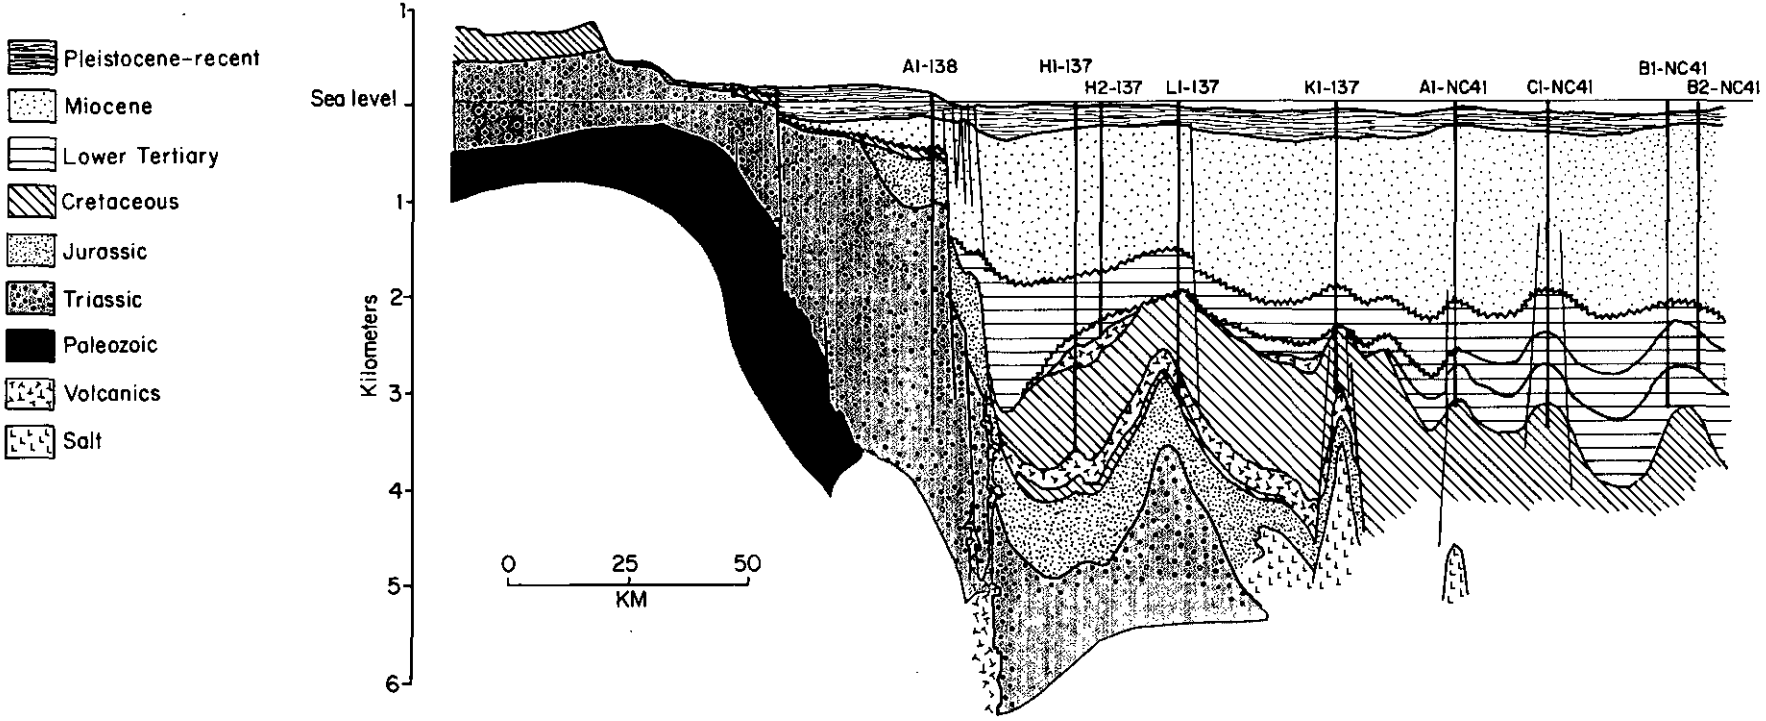

Figure 10

Geologic cross section across the northern margin of Libya based on well data and multichannel seismic reflection data. Location of the profile is shown in Figure 9 as a dashed line. The vertical exaggeration (20 : 1) is the same as for the profiles across the North American margin shown in Figure 5, so the two figures may be compared. Note the prominent hinge zone with a continental shelf sedimentary sequence to the north of it. Wavy lines represent unconformities where part of the section has been eroded. After Choignard, 1979.

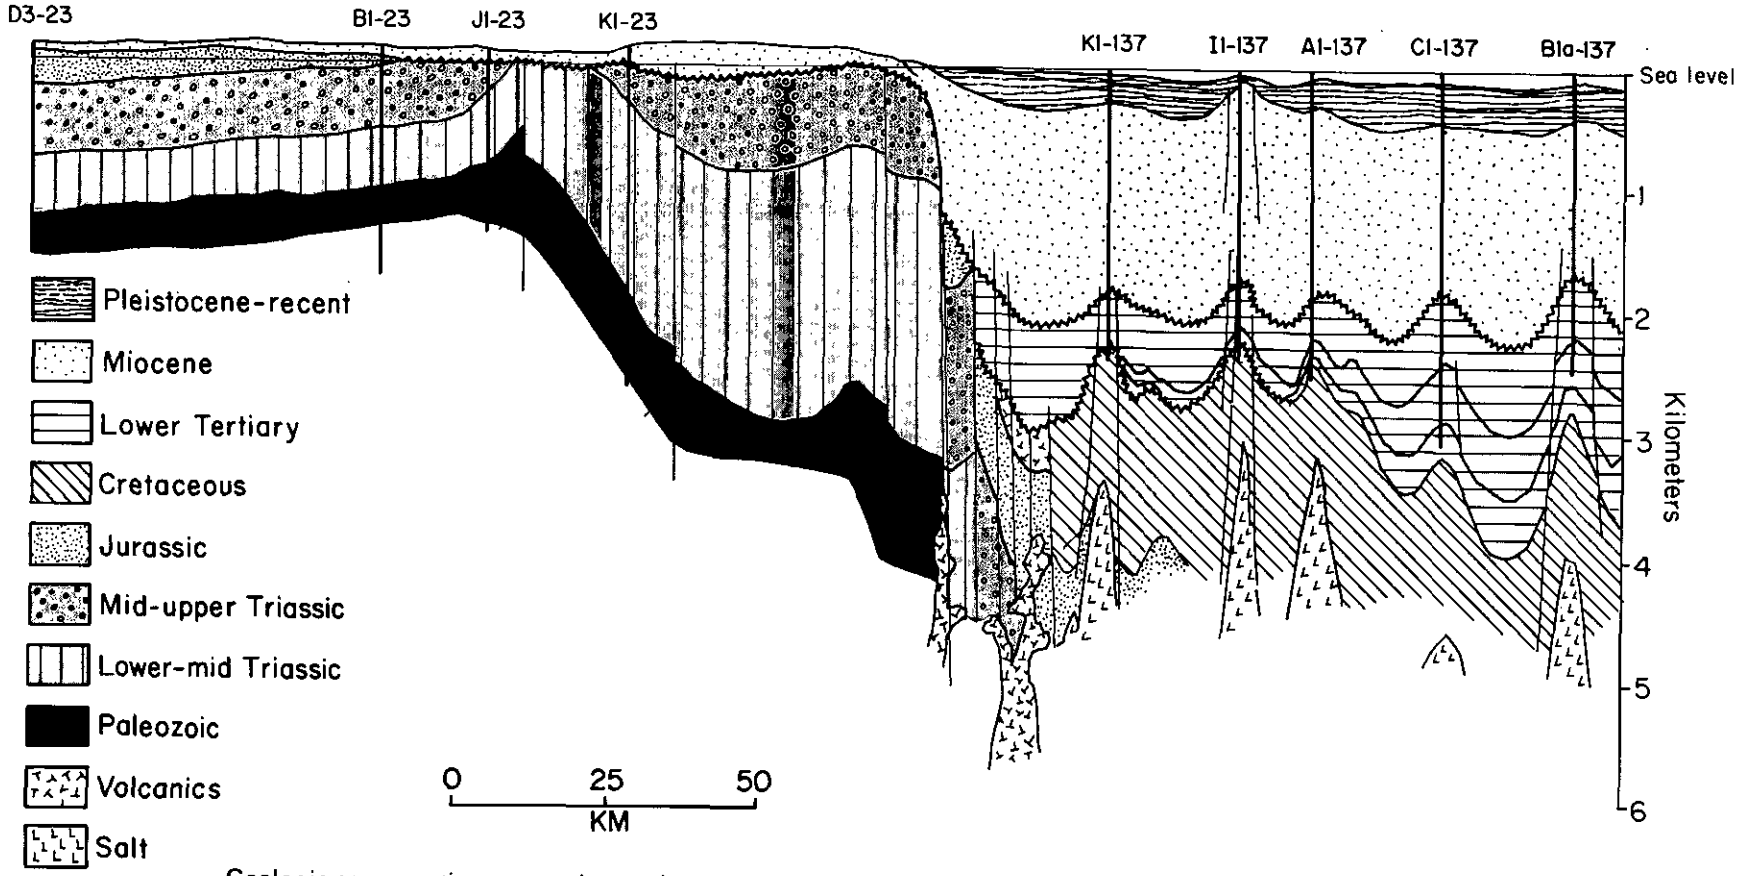

Figure 11

Geologic cross-section across the northern margin of Libya based on well data and multichannel seismic reflection data. Location of the profile is shown in Figure 9 as a solid line. The vertical exaggeration (20 : 1) is the same as for the profiles across the North American margin shown in Figure 5, so the two figures may be compared. Note the prominent hinge zone with a continental shelf sedimentary sequence to the north of it. Wavy lines represent unconformities where part of the section has been eroded. After Choignard 1979.
